Civil infrastructure

Strukton develops, builds, installs and maintains infrastructural projects, shifting the technical boundaries and using its ingenuity to make the difference.

Civil engineering structures: bridges, tunnels and viaducts in the road and rail networks

Road construction: high-quality asphaltting, concrete roads, paving, sewers, earth-moving work, maintenance and stone cladding for river and canal banks

Design, execution, maintenance and management of infrastructure projects: taking the director's role in large-scale and complex infrastructural projects with long throughput times

Underground construction: tunnelling, immersion of tunnel elements and construction of multi-storey car parks
